Project Development Phase
Performance Test

Date	10 February 2026
Team ID	PNT2022TMIDxxxxxx
Project Name	FORMULA 1 Race Intelligence Dashboard Analysis Report (2010-2026)
Maximum Marks	

Project Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Screenshot / Values
1.	Data Rendered	
2.	Data Preprocessing	
3.	Utilization of Filters	

4.	Calculation fields Used	
5.	Dashboard design	- 
6	Story Design	F1 Race Intelligence Story This visualization shows how constructor teams perform across seasons. Comparing points over time helps identify consistently strong teams and changes in championship performance. This chart compares drivers based on championship points. It helps identify the leading drivers and compare their performance in the selected season. 

Performance Test Plan and Dataset Evidence

Dataset workbook: F1 Racing Project Dataset(1).xlsx.
Sheets and data rows (excluding headers): race_results 6,464; circuits 29; championship_standings 311; lap_intelligence 3,814; qualifying_results 3,130.
Observed race_results coverage: seasons 2010–2026; 334 distinct race_id values; 19 distinct driver labels; 10 distinct team labels; 21 distinct country labels.
Available analysis fields include race date/season/round, circuit type and location, driver/team, finish/grid position, points, DNF and DNF reason, weather/wet-race flag, safety-car/VSC/red-flag data, pit stops, tyre strategy/starting compound, overtakes and laps led.
Lap-level fields include lap/sector times, tyre compound and tyre age, DRS, speed trap and pit-lap flag. Qualifying fields include qualifying position, Q1/Q2/Q3 times, gap to pole and top speed.
Validation note: workbook is a multi-sheet analytical dataset, not necessarily official complete historical timing. Verify values and data types before presenting findings. Do not infer driver nationality: no nationality field is present.
Use COUNTD([race_id]) for race-event counts where appropriate; race_results contains multiple driver-result rows per event. Distinguish race-result row counts from unique Grand Prix counts.
• Record actual Tableau load time, filter response time, screenshot evidence and environment details during execution. These values cannot be truthfully populated from the Excel file alone.
• Test at least: no filters; one season selected; one team selected; team + season; tyre compound; wet/dry; circuit type. Compare chart totals with source aggregations.
