Story

Date	24 September 2024
Team ID	PNT2022TMIDxxxxxx
Project Name	FORMULA 1 Race Intelligence Dashboard Analysis Report (2010-2026)
Maximum Marks	5 Marks

By using stories in Tableau, you can effectively communicate complex data in a way that is both interactive and engaging, making it easier for the audience to follow along and understand the insights. It's a tool for **data storytelling**, allowing you to present insights in a cohesive, engaging way that takes viewers through a logical progression of findings or analyses.

In Tableau, **Story** is a feature that allows you to create a sequence of dashboards, visualizations, and text to present data insights in a cohesive and narrative-driven way. It's like a slideshow within Tableau that guides the audience through a series of data points, helping them understand key insights, trends, or outcomes of your analysis.

Observations:

- **Technology Category Leads in Profit**: The Technology category is generating the highest profit among all categories.
- **Seasonal Sales Trend**: Sales peak in November, while February sees the lowest sales, indicating a possible seasonal trend.
- **Consumer Segment Dominates**: The Consumer segment contributes to the highest percentage of sales, accounting for 50.56%.

- **Top Revenue-Generating Product**: Chairs from the Furniture category generate the highest revenue, totaling 1.66M.

Activity 2:

Publish Story on Tableau Public and Paste Public link below

Tableau Story: Recommended Narrative

Story point 1 — The dataset and scope: introduce five sheets, 6,464 race-result rows, 29 circuits and seasons 2010–2026 as represented in the workbook. Clarify that row count is not the same as unique race count.

Story point 2 — Who scores the points? Present the driver leaderboard and let the audience select a season.

Story point 3 — Constructor competition: compare points by season, emphasizing trends rather than asserting causality.

Story point 4 — Tyre strategy: compare compound usage and tyre-age/lap-time patterns from lap_intelligence.

Story point 5 — Podiums and circuits: show podium distribution and event/circuit comparisons after validating COUNTD(race_id).

Story point 6 — Reliability: show DNF counts and available reason categories, then compare circuit type/weather. Note that 6,068 of 6,464 DNF-reason cells are null in the supplied race_results sheet; reason-based conclusions cover only populated records.

Story point 7 — Summary and limitations: summarize only observations visible in the final workbook. Nationality analysis needs a separate nationality lookup; Tableau Public link must be inserted after publishing.
